Description

This comprehensive training program is tailored to provide attendees with practical analyst skills in Cyber Threat Intelligence (CTI) using MISP - one of the most widely used Threat Intelligence Platform (TIP) platform in the field. MISP is a powerful open-source threat intelligence platform organizations can use to store, share and receive information about malware, threats, and vulnerabilities in a structured way. Participants will examine the logic of different tasks analyst do, immerse themselves in real-world scenarios to understand how responder teams effectively leverage CTI through MISP. They will learn how to extract valuable insights from intelligence feeds and master the formulation of strategic questions to maximize organizational benefits. Additionally, the focus on the added value of contributing to the TIP will be covered, teaching participants how to create queries and share intelligence effectively. With a dedicated emphasis on intelligence sharing, students will gain crucial insights into what, how, and to whom information can be shared for various purposes. Access to the MISP platform will be provided, allowing participants to practice and complete homework assignments designed to reinforce their learning.

Registration information

Unless specified otherwise, all ITU Academy training courses are open to all interested professionals, irrespective of their race, ethnicity, age, gender, religion, economic status and other diverse backgrounds. We strongly encourage registrations from female participants, and participants from developing countries. This includes least developed countries, small island developing states and landlocked developing countries.
